Gate Supply Voltage (min.)	-5 V
CW Duty Cycle	10 % to 100 %

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

These electronic devices are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.

Absolute Maximum Ratings[2,3]

Parameter	Unit
RF Input Power	28 dBm
Drain Supply Voltage	28V
Gate Supply Voltage (min.)	-6 V
Junction Temperature	+225°C
Storage Temperature	-55°C to +150°C

2. Exceeding any one or combination of these limits may cause permanent damage to this device.
3. MACOM does not recommend sustained operation near these survivability limits.
4. Operating at nominal conditions with $T_J \leq$ +200°C will ensure MTTF > 1 x 10^6 hours.
5. Junction Temperature (T_J) = T_C + Ѳjc * (V * I-(P_{OUT}-P_{IN}))
   Typical thermal resistance (Ѳjc) = TBD °C/W.
   a) For T_C = +25°C, quiescent conditions:
      T_J = TBD °C @ 22 V, 190 mA
   b) For T_C = +85°C, quiescent conditions:
      T_J = TBD °C @ 22 V, 190 mA
6. T_C is defined as backside of die

Application Notes

MAPC-MP0013-DIE is designed to be easy to use yet high performance. The ultra small size and simple bias allows easy placement on system board. RF output ports are DC de-coupled internally. RF input port has DC connection to the ground for the ESD protection purpose.

Die Attachment

This product is manufactured from 0.1 mm (0.004”) thick SiC substrate and has vias through to the backside to enable grounding to the circuit.

Recommended conductive epoxy is Namics Unimec XH9890-6. Epoxy should be applied and cured in accordance with the manufacturer’s specifications and should avoid contact with the top of the die.

Supply Sequencing

Turn-on

1. Apply V_G (-5 V).
2. Apply V_D (22 V typical).
3. Set I_{DQ} by adjusting V_G more positive (typically V_G~ -3.9 V for I_{DQ} = 190 mA).
4. Apply RF_{IN} signal.

Turn-off

1. Remove RF_{IN} signal.
2. Decrease V_G to -5 V.
3. Decrease V_D to 0 V.

Biasing Conditions

Recommended biasing conditions are:
V_D = 22 V, I_{DQ} = 190 mA (controlled with V_G).

V_D bias must be applied to V_D1, V_D2, V_D3, and V_D4 pads.

Both V_D3 pads (8, 16) are required for current symmetry.

Both V_D4 pads (9, 15) are required for current symmetry.

A single DC voltage (V_G) will bias all amplifier stages. Muting can be accomplished by setting the V_G to the pinched off voltage (V_G = -5 V).
